

#### **About Us**

The Photonic Detection technical group is part of the Photonics and Opto-Electronics Division of the Optical Society. This group focuses on the detection of photons as received from images, data links, and experimental spectroscopic studies to mention a few. Within its scope, the PD technical group is involved in the design, fabrication, and testing of single and arrayed detectors.

This group focuses on materials, architectures, and readout circuitry needed to transduce photons into electrical signals and further processing. This group's interests include: (1) the integration of lens, cold shields, and readout electronics into cameras, (2) research into higher efficiency, lower noise, and/or wavelength tunability, (3) techniques to mitigate noise and clutter sources that degrade detector performance, and (4) camera design, components, and circuitry.

#### **Executive Board**

Shayan Garani Srinivasa, Chair (Indian Institute of Science), shayan.gs@dese.iisc.ernet.in
Francesco Marsili, Vice Chair (JPL), francesco.marsili.dr@jpl.nasa.gov
Rajesh Nair, Treasurer (Indian Institute of Technology Ropar), rvnair@iitrpr.ac.in

- Optical Communications (PC)

#### **Planned Technical Group Activities**

#### Our activities include:

- Special sessions at leading OSA conferences. We had a successful panel discussion at OSA FiO 2015.
- Webinars. We have planned about 3-4 webinars for 2016.
- Proposal on a journal special issue covering PD activities.
- Interaction with local sections and student chapters. We are in the process of setting this up.
- Proposal for the creation of student poster awards at OSA meetings.
- Road map towards solving outstanding research problems.

#### Outreach:

- Regular communications (distribution list announcements and listservs)
- Create and maintain an active/engaged social media/networking functions (e.g., SharePoint, Google Plus, Twitter, Facebook, and/or LinkedIn).

# Novel route of hybrid thin film deposition for applications in opto-electronics and energy devices

### **Adrienne D. Stiff-Roberts**

Department of Electrical and Computer Engineering Research Triangle Materials Research Science and Engineering Center (RT-MRSEC) Duke University Durham, NC 27708

OSA Photon Detection Group Webinar July 14, 2016

# Organic and Hybrid Optoelectronic Devices

Organic and hybrid materials are attractive for optoelectronic devices due to inexpensive and sustainable raw materials, structural flexibility, light weight, and broad range of material properties and functionality.

# Inorganic Optoelectronic Heterostructures

Type II Strained-Layer
 Superlattice IR Photodetector

Multi-junction Solar Cell

http://opticalengineering.spiedigitallibrary.org/article.aspx?articleid=1306494

http://en.wikipedia.org/wiki/Multijunction\_photovoltaic\_cell

Inorganic optoelectronic devices benefit from well-established deposition techniques that enable heterostructure design.

6

## **Solution-Processed Deposition**

Most organic materials are soluble in organic solvents and can be deposited by solution-processed deposition techniques, which are simple methods to deposit organic thin films with low cost and on a large scale.

**Solution-processed depositions involve three steps:** 

- a) Preparation of target materials solution.
- b) Spread the solution onto the substrate.
- c) Evaporation of the solvent and film formation.

#### Spin-casting

Ink jet printing

Gravure printing

Krebs, F.C., Fabrication and processing of polymer solar cells: A review of printing and coating techniques. Solar Energy Materials and Solar Cells, 2009. 93(4): p. 394-412.

# **Solution-Processed Deposition**

### **Disadvantages:**

- 1. Phase separation in blended films driven by solvent evaporation process.
- 2. Not able to deposit blended films comprising two materials with different solubility characteristics. (e.g., hydrophilic and hydrophobic materials)
- 3. Not able to deposit multi-layer films comprising different materials with the same solubility characteristics in each layer.

# Depositing films in a "dry" state could potentially address these challenges.

 $\rightarrow$  Thermal evaporation is appropriate for organic small molecules that are thermally robust, but not for macromolecules and polymers that can decompose at elevated temperatures.

target

EMUND I. PRATT, JR. SCHOOL OF ENGINEERING

# What is MAPLE?

### **MAPLE enables:**

- tailored material composition
- novel film structure
- heterostructure design
- use of same process, regardless of thin-film material or substrate

### **Parameter Space:**

- 1. Target composition
- 2. Chamber pressure
- 3. Substrate temperature
- 4. Growth distance
- 5.Fluence

### Matrix-Assisted Pulsed Laser Evaporation

# Emulsion-based, Resonant Infrared, Matrix-Assisted Pulsed Laser Evaporation (RIR-MAPLE)

### Unique RIR-MAPLE Techniques Developed by Stiff-Roberts Group

### **Emulsion Host Matrix**

The emulsion host matrix contains: primary solvent, secondary solvent, DI water (containing surfactant).

- Primary solvent is used to dissolve the target organic materials.
- Secondary solvent is mainly used to prevent frozen target sublimation under the vacuum, and also enrich the OH concentration in the emulsion.
- **DI water (containing surfactant)** is used to enrich the OH concentration to absorb the laser energy.

R. Pate and A. D. Stiff-Roberts, Chemical Physics Letters, vol. 477, pp. 406-410, August 2009.

### **Unique RIR-MAPLE Techniques Developed by Stiff-Roberts Group**

### **Emulsion Host Matrix**

- The laser energy is resonant with hydroxyl bond (O-H) vibrational modes.
- The concentration of hydroxyl bonds in the target can be tuned by using oil-inwater emulsions.

G. M. Hale and M. R. Querry, *Appl. Opt.,* vol. 12, pp. 555-563 (1973)

The emulsion approach decouples the organicbased target material from the laser energy.

Decreasing vapor pressure and solubility-in-water

### 23 Effect of Primary Solvent - Growth Mechanisms

### Solubility-in-Water

Solubility-in-water: Solubility-in-water: 30 g/100g RED: 0.77

0.792q/100q RED:0.61

Solubility-in-water: 0.00488 g/100g RED:0.74

For lower solubility-in-water, the emulsified particle size decreases. The polymer films are formed by discrete polymer clusters resulting from direct transfer of emulsified particles by laser irradiation of the target.

### **Vapor Pressure**

Nahen K, Vogel A; Plume dynamics and shielding by the ablation plume during er:yag laser ablation. J. Biomed. Opt. 0001;7(2):165-178.

For lower vapor pressure, fewer solvent molecules are created for the same incident laser energy. As a result, solvent molecules in the plume are less likely to get trapped in the deposited film, leading to more tightly packed films.

\* Manuscript submitted.

# Deposition of Hybrid Nanocomposites

# **Deposition Modes for Blended Films**

### Advantages of sequential deposition:

- Provides co-deposition, but different solvents chosen to optimize solubility and film morphology of each component
- Sequential deposition reduces the impact of solubility characteristics of one component on the deposition of another component.

R. Pate, K. R. Lantz, and A. D. Stiff-Roberts, Thin Solid Films, 517, 6798 (2009).

### **Tandem Solar Cell Active Regions**

# Conclusions

- •Emulsion-based RIR-MAPLE is appropriate for a wide range of organic and hybrid material systems.
- •The emulsion target recipe has a significant impact on the performance of organic optoelectronic devices.
- •Hybrid material systems may benefit most from the unique film properties resulting from emulsion-based RIR-MAPLE.
- •The future prospects for emulsion-based RIR-MAPLE include serving as an enabling technology for materials by design (e.g., controlling the crystallinity, orientation, and packing of polymer films or tailoring the nanoscale composition of blended films to achieve desired bulk properties).
